

**“Multicenter Evaluation of Memory Remediation after TBI with Donepezil”  
MEMRI Study**

- Purpose:** To determine if donepezil is an effective treatment for memory problems among adults who experienced a TBI 6-36 months ago.
- To Qualify:** Men & Women, 18 – 60 years old, who have sustained a traumatic brain injury 6 and 36 months ago. Subjects must have a family member or friend who can participate in the study with them.
- Length of Study:** 12 to 14 Weeks
- Study Visits:** **4 Visits Total**
- **Screening Visit (3 hours)**
  - **Baseline Visit (3 hours)**
  - **Week 6 Visit (3 hours)**
  - **Week 10 Visit (3 hours)**
- Procedures:**
- Physical exam and blood draw
  - Questionnaires and Neuropsychological Testing
  - Randomization to receive either Donepezil or placebo group for 10 weeks
- Exclusions:** **Subjects will be excluded if:**
- Age younger than 18 or older than 60 years
  - Traumatic Brain Injury is less than 6 months ago or more than 3 years ago
  - Currently taking Galantamine, donepezil and other medications
- Stipend:**
- \$30 stipend & Parking Voucher for completing the screening and each of the study visits for a total payment of up to \$120
